Summary

DevOps-focused Computer Engineering student with strong foundations in system architecture, CI/CD pipelines, and Linux administration. Passionate about self-hosted infrastructure, open-source automation, and maintaining telemetry-free environments. Adept at bridging low-level system engineering with modern containerized workflows, utilizing languages like C++ and Go alongside robust orchestration tools. Proven ability to design local server deployments, optimize network topologies, and build efficient, reliable development pipelines from the ground up.

Education

Haliç University | B.S. in Computer Engineering | 2024–2028 | GPA: 3.06/4.00

Experience

IT Engineering Intern | July 2026

- Mapped corporate network topologies and analyzed subnets using Nmap.
- Configured CUPS print servers to optimize local network print routing.
- Performed physical maintenance and port configuration on server cabinets and network switches.

Projects

- **Sadecekeci:** Migrated a containerized web infrastructure from a cloud environment to a locally hosted DevOps pipeline running on a private GitHub Actions runner. Orchestrated the architecture using Docker Compose, integrating PostgreSQL, Prometheus, and MinIO.
- **User-Adder-List:** Engineered a Python and Bash utility to automate system user creation and manage structured account lists, streamlining administrative provisioning workflows.
- **Spring Boot MVC App:** Built a comprehensive user registration web application featuring a controller-layer architecture, Thymeleaf templates, and H2 database integration for full CRUD operations.

- **Youtube-bot:** Engineered an automated Python-based video publisher, integrating JSON response validation and a local Llama AI model.
- **ESP32 Digital Voice Modulator:** Developed a portable hardware device utilizing an ESP32 microcontroller, I2S protocol, and custom C++ libraries for real-time audio signal processing.
- **Network Simulation:** Conducted discrete event network modeling and topology behavior analysis within the OMNeT++ simulator workspace.

Technical Skills

Languages:	C/C++, Python,Java, Bash, Zsh,Go
DevOps:	Docker, Kubernetes, GitHub Actions, Prometheus, Grafana, MinIO, PostgreSQL
Tools/Networking:	Arch Linux, Nmap, CUPS, Git, Maven, ESP32

Events & Hackathons

- Vibecoding Sprint AI (Özyeğin Univ), July 2026
- Cursor Hackathon (Haliç Univ), May 2026
- ACUHIT Hackathon (Acıbadem Univ), March 2026
